

ABSTRACT

A patch panel system (100) includes interface units (120) and radio units (130). The interface units (120) connect to user devices (110) via corresponding ports. The radio units (130) are associated with radio channels. Combinations of the interface units (120) and the radio units (130) provide conversion of constant bit rate communication to packetized communication and reconversion of the packetized communication to the constant bit rate communication.
